## **CISC-102 FALL 2016**

## HOMEWORK 1 SOLUTIONS

## Problems

- (1) Rewrite the following statements using set notation, and then give an example by listing members of sets that match the description. For example: A is a subset of C. Answer:  $A \subseteq C$ .  $A = \{1, 2\}, C = \{1, 2, 3\}$ .
  - There are many different solutions to these questions. I have shown several possibilities.
  - (a) The element 1 is not a member of (the set) A.  $1 \notin A$ .  $A = \{2, 4\}$ .
  - (b) The element 5 is a member of B.  $5 \in B. B = \{5,6\}$
  - (c) A is not a subset of D. A  $\not\subset$  D. A = {2, 4} and D = {42, 18}.
  - (d) E and F contain the same elements.
    - $E = F. E = F = \{7\}. E \subseteq F \text{ and } F \subseteq E.$
  - (e) A is the set of integers larger than three and less than 12. A = {  $x : x \in \mathbb{Z}, 3 < x < 12$  }. A = { 4, 5, 6, 7, 8, 9, 10, 11}.
  - (f) B is the set of even natural numbers less than 15. B =  $\{ 2x : x \in \mathbb{N}, x < 8 \}$ . B =  $\{2,4,6,8,10,12,14\}$ .
  - (g) C is the set of natural numbers x such that 4 + x = 3. C = { $x : x \in \mathbb{N}, 4 + x = 3$  }. C =  $\emptyset$ .
- (2)  $A = \{x : 3x = 6\}$ . A = 2, true or false?  $A = \{2\}$ .  $A \neq 2$ , so the statement is false.
- (3) Which of the following sets are equal  $\{r, s, t\}$ ,  $\{t, s, r\}$ ,  $\{s, r, t\}$ ,  $\{t, r, s\}$ . They are all equal. The order in which elements are written in a set is not important, unless ellipses "..." are used to denote a sequence. For example  $x = \{1, 2, ..., 10\}$ .
- (4) Consider the sets  $\{4, 2\}$ ,  $\{x : x^2 6x + 8 = 0\}$ ,  $\{x : x \in \mathbb{N}, x \text{ is even}, 1 < x < 5\}$ . Which one of these sets is equal to  $\{4, 2\}$ ? They are all equal.
- (5) Which of the following sets are equal: Ø, {Ø}, {0}. None are equal. {Ø} is a set within a set. 0 is a number not a set, and definitely not the empty set.
- (6) Explain the difference between  $A \subseteq B$ , and  $A \subset B$ , and give example sets that satisfy the two statements.

 $A \subseteq B$  is pronounced as "A is a subset of B" implying that A is a subset of B that may also be equal to A.  $A = B = \{1\}$ .  $A \subset B$  is pronounced "A is a proper subset of B" implying that A is strictly a subset of B.  $A = \{1\}$ ,  $B = \{1,2\}$ .

## HOMEWORK 1 SOLUTIONS

- (7) Consider the following sets  $A = \{1, 2, 3, 4\}, B = \{2, 3, 4, 5, 6, 7\}, C = \{3, 4\}, D = \{4, 5, 6\}, E = \{3\}.$ 
  - (a) Let X be a set such that  $X \subseteq A$  and  $X \subseteq B$ . Which of the sets could be X? For example X could be C, or X could be E. Are there any other sets that could be X?
    - X could also be  $\{2,3,4\}$ .
  - (b) Let  $X \not\subseteq D$  and  $X \not\subseteq B$ . Which of the the sets could be X? Sets A is the only set from the list that is not a subset of D and not a subset of B. There are infinitely more possibilities of sets that satisfy these requirements. For example all sets  $X_i = \{x : x \in \mathbb{N}, x > 8 + i\}$  for all values of  $i \in \mathbb{N}$ , represents an infinite collection of sets that are not subsets of B or D.
  - (c) Find the smallest set M that contains all five sets. M =  $\{1,2,3,4,5,6,7\}$
  - (d) Find the largest set N that is a subset of all five sets.  $N = \emptyset$
- (8) Is an "element of a set", a special case of a "subset of a set"? No, an element of a set is not a subset.
- (9) Phrase the handshake counting problem using set theory notation. How many two element subsets can be chosen from an n element set.
- (10) List all of the subsets of  $\{1, 2, 3\}$ .
  - $\emptyset, \{1\}, \{2\}, \{3\}, \{1,2\}, \{1,3\}, \{2,3\}, \{1,2,3\}.$
- (11) Let  $A = \{a, b, c, d, e\}$ . List all the subsets of A containing a but not containing b. {a}, {a,c}, {a,d}, {a,e}, {a,c,d}, {a,c,e}, {a,d,e}, {a,c,d,e}

 $\mathbf{2}$
