

CISC 327 - Software Quality Assurance

Lecture 5

Agile development
eXtreme Programming

Agile Development

- A **group of software development methods**
 - **Early and continuous delivery** of software
 - Welcome **changing requirements**, even late in development
 - Business people and developers must **work together**
 - **Working software** is the primary measure of progress
 - **Self-organizing teams** produce the best architectures, requirements, and designs
 - **Reflect and tune behaviour** at regular intervals to become more effective

Agile Development Values

Individuals and interactions over processes and tools
Working software over comprehensive documentation
Customer collaboration over contract negotiation
Responding to change over following a plan

- Although there is value in the **items on the right**, agile software developers value **the items on the left** more

eXtreme Programming

- **A Modern, Lightweight Software Process**
 - Extreme Programming, or **XP**, is a modern lightweight process suitable for small to medium-sized software projects
 - Designed to adapt well to the observed realities of modern software production
 - short **timelines**
 - high **expectations**
 - severe **competition**
 - unclear and rapidly changing **requirements**

eXtreme Programming

- A Modern, Lightweight Software Process
 - Based on the idea of continuous **evolution**
 - Very **practical**, based largely on simplicity, testing
 - In spite of its brash, undisciplined, "**fun**" presentation, solidly based on the software **disciplines** and **processes** of the past

What's So eXtreme About It?

- Why is it called **Extreme**?
 - When first conceived, the idea was to take the **best practices** of good software development to the limit
 - if **code reviews** are good, review code **all the time**
 - if **testing** is good, test **all the time**
 - if **design** is good, design **all the time**
 - if **simplicity** is good, always use the **simplest solution possible**
 - if **architecture** is important, refine architecture **all the time**
 - if **integration** is important, integrate **all the time**
 - if **short iterations** are good, use **shortest iterations possible**
 - Clearly this can only work for relatively **small** projects

Great, Another Process...

- **Why make a different approach?**
 - XP was born from the **dissatisfaction** of programmers with the actual situation in most software development environments
 - Frustration with the lack of **time to test** adequately because of the rush to get new software and new versions out quickly

Great, Another Process...

- **Why make a different approach?**
 - Dissatisfaction with the lack of ongoing advice and **social support** for difficult technical decisions, and management **blame** for decisions that do not turn out well
 - Worry about **lack of connection** between planning and design activities and actual source code
 - Working software is the primary measure of progress
 - Worry about the **communication gap** between management and technical staff

eXtreme Programming Properties

- **Characteristics of XP**
 - In many ways, **XP** is a **philosophy** rather than just a process
 - It is characterized by:
 - continuing **feedback** from short cycles
 - **incremental** planning that evolves with the project
 - responsive **flexibility** in scheduling
 - heavy and continuous use of **testing** and test **automation**

eXtreme Programming Properties

- **Characteristics of XP**
 - emphasis on close and continuous **collaboration** and communication
 - use of **tests** and **source code** as primary communication media (communication at programmer's level)
 - **evolutionary** model from conception to retirement of system
 - emphasis on small, **short-term** practices that help yield high quality **long-term** results

Attacking Risks Before They Arise

- Addressing Risk
 - XP tries to explicitly address the greatest risks to software development projects actually observed in practice

Attacking Risks Before They Arise

- 1) Schedule Slips

- Software isn't ready on the **scheduled** delivery date
- Addressed in **XP** by **short** release cycles, frequent delivery of **intermediate** versions to customers, customer **involvement** and feedback in development of software

Attacking Risks Before They Arise

- 2) Project Cancellation
 - After several schedule slips, the project is cancelled
 - Addressed in XP by making the smallest initial release that can work, and putting it into production early, thus establishing credibility and results

Attacking Risks Before They Arise

- 3) System Defect Rate Too High, or Degrades with Maintenance
 - Software put in production, but defect rate is too high, or after a year or two of changes rises so quickly that system must be discarded or replaced
 - Addressed in XP by creating and maintaining a comprehensive set of tests run and re-run after every change, so defect rate cannot rise
 - Programmers maintain tests for each function, users maintain tests for each system feature

Attacking Risks Before They Arise

- 4) Business Misunderstood
 - Software put in production, but doesn't solve the **problem** it was supposed to
 - Addressed in **XP** by making **customer** an integral part of the team, so team is continually **refining specification** to meet expectations

Attacking Risks Before They Arise

- 5) Business Changes

- Software put in production, but business problem it is designed for **changes** or is **superseded** by new, more pressing business problems
- Addressed in **XP** using short release cycles and by having **customer** as an integral part of the team
- Customer helps team continually **refine specification** as business issues change, **adapting** to new problems as they arise - programmers don't even notice

Attacking Risks Before They Arise

- 6) Featuritis

- Software has a lot of potentially interesting features, which were **fun to implement**, but don't help customer make more money
- Addressed in **XP** by addressing **only** the highest priority tasks, maintaining focus on real problems to solve

Attacking Risks Before They Arise

- 7) Staff Turnover
 - After a while, the best programmers begin to **hate** the same old program, get bored and leave
 - In **XP**, programmer make their **own** estimates and schedules, get to plan their **own** time and effort, get to test thoroughly
 - Less likely to get frustrated with **impossible** schedules and expectations
 - In **XP**, emphasis is on day to day social human **interaction**, pair and team effort and decisions
 - Less likely to feel **isolated** and unsupported

Criticisms of XP

- Introduction of **XP** resulted in **immediate criticism**
 - Insufficient **software design**
 - Lack of **structure** and **documentation**
 - Only as **effective** as the people involved
 - Agile methods like XP often require **senior developers**
 - Can be **inefficient**
 - Pair programming can be **difficult and expensive**, although **rewarding**

XP 1st ed. / XP 2nd ed.

- Second edition of Beck's book, which we are **not** following at all, changed a lot of things
- 2nd edition subtitled "EMBRACE CHANGE": XP applied to itself (very convenient...)
- Dropped some useful technical content (refactoring, coding standards)
- Added some other things (open plan offices...)

Summary

- **eXtreme Programming**
 - A new software process, **programmer-centred**
 - Strongly based on **testing** at every level
 - Designed to address usual project failure **risks** before they arise
 - We will revisit and **attach** our course material to **eXtreme** as we go along

XP in Practice

- Outline

- Here we look at the actual **practices** of the XP process, and how they can be applied in the context of our project
- The **key ideas** to keep in mind at all times are:
 - metaphor
 - **simplicity**
 - testing
 - automation
 - **collective** work
 - standards

Agile Development

Individuals and interactions over processes and tools
Working software over comprehensive documentation
Customer collaboration over contract negotiation
Responding to change over following a plan

Although there is value in the items on the right, agile software developers value the items on the left more.

<http://agilemanifesto.org>

XP 1: The Planning Game

- Refers to the practice of having a continuous dialog between business and technical people on the project
 - Often in the form of weekly **meetings**, where business people bring **business** constraints, and technical people bring **technical** constraints
 - Business people bring issues of **scope, priority, releases**
 - Technical people bring **estimates, consequences, scheduling**
 - Forces the project members to continually balance what is **possible** (the technical aspects) with what is **desirable** (the business aspects)
 - Unfortunately we won't really be able to practice this in the project, the closest we come is our dialog in class and email

XP 2: Small Releases

- Refers to the practice of addressing only the **most pressing** business requirements, and getting them addressed by releasing a new version **quickly**
 - Means that we should bring the **first version** into production as quickly as possible
 - Means that we should shrink the cycle to the **next version** as much as possible
 - In practice this means shrinking software cycles to **a month or two** instead of six months or a year
 - In our project, we will shrink to quick releases at roughly **two week** intervals

XP 3: Metaphor

- Refers to the practice of understanding and speaking of the system in real-world terms **independent** of its programmed solution
 - An example of a metaphor is the "**desktop**" of modern operating systems
 - The goals in building such an operating system can be understood in terms of an **office desk**
 - The metaphor drives the design of the **architecture** and **interfaces** of the system
 - In our project, the metaphor is "**native**", that is, there is a natural physical understanding of what we are doing, our front end is simply a **retail console**

XP 4: Simplicity

- Refers to the practice of always using the **simplest possible** design and code that can handle the tests
 - Do not **speculate** or try to guess what will be needed in the future, address only the current **test suite**
 - Do not implement **any** features that do not affect the **test results**
 - In our project, the **simplest, smallest** solution will be considered the best

XP 5: Testing

- The only required program features are those for which there is an **automated test**
 - Always create tests **first**, and treat them as the goal (**specification**)
 - Programmers create **unit tests** (tests for each method or segment of code)
 - Customers create **functional (acceptance) tests** that check that the product has the required functionality
 - In our project, we will create explicit tests **first** as we go along, beginning with assmt. #1, and program to meet them

XP 6: Refactoring

- Refers to the practice of continually looking for ways to **simplify** the architecture and coding of the system as new features and changes are made
 - When a new feature or change is needed, we first look to see if there is a way to **rearchitect** the system to make it easier or simpler to add - if so, we rearchitect first
 - Once the new feature has been added or changed, we look to see if the resulting new program can be **simplified** by rearchitecting or merging similar code
 - In our project, we will face **changes** that may require refactoring

XP 7: Pair Programming

- Refers to the practice of having all production code written with two people working **together** on one terminal
 - One partner works **tactically** on the specific part of the code (e.g. method) being coded at the moment
 - The other partner works **strategically**, considering higher level issues such as:
 - is this **approach** going to work?
 - can we **simplify** this by restructuring?
 - what other **tests** do we need to address here?
 - In our project, we will do all programming in **pairs**

XP 8: Collective Ownership

- Refers to the practice of having **everyone responsible** for the quality of the software, and **no one to blame** for failures of the software
 - Everyone is responsible for identifying **opportunities** to improve things and to **act** upon them at any time
 - No one **owns** the code, it belongs to everyone **together** - there is no notion of "**my code**", only the universal notion of "**our code**"
 - In our project, all team members will be **collectively** responsible for all parts of all phases

XP 9: Continuous Integration

- In XP, new code is always integrated and **tested** within a day
 - Changes are not allowed to go on without being continually tested **in context** to catch integration failures before they happen
 - In our project, starting with assignment #2, we will model this by testing again **immediately** after each day's changes

XP 10: On-site Customer

- A **real customer** must be a part of the development team at all times
 - Must be available to answer questions, resolve disputes, set short-term priorities based on **business knowledge**
 - In our project, we will model this by having the customer (me) available by **email** (not quite right, but it will have to do!)

XP 11: Coding Standards

- Project-wide conventions about the coding of programs
 - Necessary since everyone is responsible for **all** of the code, and may have to read or change any part of it at any time
 - Usually specifies
 - **Commenting** standards, e.g., every method must have a comment of the form ...
 - **Naming** conventions, e.g., variables representing dates will always be named ending in "Date", all constant will be named with a two letter prefix indicating their business type
 - In our project, you will be required to specify your coding standards, and they will be judged according to the **clarity, readability, and consistency** of your code.

Summary: XP Practices

- **XP Practices**
 - XP uses a set of **standard practices** that together form an easy to apply practical **system** for team development of software
 - Emphasis is on **collective** responsibility, **continuous** improvement, and **high quality** standards
 - We will **try** to apply these practices in the course project
