

## **CISC / CMPE 327 Software Quality Assurance (Fall 2018)**

### **Mini-Exam #1 Hints**

Mini-Exam #1 covers **Lectures 1 through 5** and associated readings. That is, it covers all of Quality Assurance, Software Processes, Process Evaluation and Standards, and Extreme Programming (XP).

Here are the kinds of questions that have appeared on past Quizzes and Exams in this portion of the course.

1. What are the three general principles of quality assurance?
2. Match a list of quality parameters (correctness, usability, ...) with their definitions and kinds (technical or user).
3. Name and describe the four fundamental software process activities.
4. Given a description of how Company X does their software process, identify the process they think they are using, and describe what they are doing wrong.
5. Match each of a list of software processes with their strengths and weaknesses.
6. Associate each of the following XP practices with the risks to project success they are designed to address (or vice versa).

You can also find questions relating to this section of the course in old exams in the ExamBank:

<http://library.queensu.ca/search/exams-exambank>

Just search for “Computing” “327”, without specifying a year. While most of the exams are old, this section of the course has changed little.
