

## DBMS Buffer Management

Putting the data in main memory!

---

---

---

---

---

---

---

## DBMS Buffer

- Data must be in RAM for DBMS to operate on it!
- Table of  $\langle \text{frame\#}, \text{pageid} \rangle$  pairs is maintained.

CISC 432/832

2

---

---

---

---

---

---

---

## Requesting a Page

- If requested page is not in pool:
  - Choose a frame for *replacement*
  - If frame is dirty, write it to disk
  - Read requested page into chosen frame
- *Pin* the page and return its address.
  - \* If requests can be predicted (e.g., sequential scans) pages can be pre-fetched several pages at a time!

CISC 432/832

3

---

---

---

---

---

---

---

## Managing a Page

- Requestor of page must unpin it, and indicate whether page has been modified:
  - *dirty* bit is used for this.
- Page in pool may be requested many times,
  - a *pin count* is used. A page is a candidate for replacement iff *pin count* = 0.
- CC & recovery may entail additional I/O when a frame is chosen for replacement. (*Write-Ahead Log* protocol; more later.)

CISC 432/832

4

---

---

---

---

---

---

---

## Buffer Replacement Policy

- Frame is chosen for replacement by a *replacement policy*:
  - Least-recently-used (LRU), Clock, MRU etc.
- Policy can have big impact on # of I/O's; depends on the *access pattern*.
- Sequential flooding: Nasty situation caused by LRU + repeated sequential scans.
  - # buffer frames < # pages in file means each page request causes an I/O. MRU much better in this situation (but not in all situations, of course).

---

---

---

---

---

---

---

## Page Replacement Algorithms

- Algorithms can be classified as
  - prefetching
  - demand
- Performance measured by

$$\text{Miss rate} = \frac{\# \text{ of physical references}}{\# \text{ of logical references}}$$

CISC 432/832

6

---

---

---

---

---

---

---

Page Replacement Algorithms (cont.)

		Age		
		No consideration	Most recent reference	First reference
references	No consideration	Random		FIFO
	Most recent reference		LRU CLOCK	
	First reference	LFU	GCLOCK	LRD

CISC 432/832

7

---

---

---

---

---

---

---

Page Replacement Algorithms (cont.)

- FIFO (First-In-First-Out)
  - replaces oldest buffer page
- LFU (Least Frequently Used)
  - replaces page with lowest reference frequency
- LRU (Least Recently Used)
  - replaces page least recently referenced / unfixed

CISC 432/832

8

---

---

---

---

---

---

---

Page Replacement Algorithms (cont.)

- CLOCK
  - simulates LRU behaviour by stepping through pages and checking use bit
- GCLOCK (Generalized CLOCK)
  - combines LFU and CLOCK
  - use bit replaced with reference counter
  - step through looking for page with 0 reference counter

CISC 432/832

9

---

---

---

---

---

---

---

## Page Replacement Algorithms (cont.)

- LRD (Least Reference Density)
  - reference density relates number of references to the age of a page
  - replace page with lowest reference density

CISC 432/832

10

---

---

---

---

---

---

---

## Multiple Buffer Pools

- Recent products like DB2/UDB use multiple buffer pools instead of a single buffer area
- Tablespaces assigned to specific buffer pools
- Replacements from within the one pool

CISC 432/832

---

---

---

---

---

---

---

## DBMS vs. OS File System

OS does disk space & buffer mgmt: why not let OS manage these tasks?

- Differences in OS support: portability issues
- Some limitations, e.g., files can't span disks.
- Buffer management in DBMS requires ability to:
  - pin a page in buffer pool, force a page to disk (important for implementing CC & recovery),
  - adjust *replacement policy*, and pre-fetch pages based on access patterns in typical DB operations.
