## **External Sorting**

## Why Sort?

- A classic problem in computer science!
- Data requested in sorted order
- e.g., find students in increasing average order
- Sorting is first step in *bulk loading* B+ tree index.
- Sorting useful for eliminating *duplicate copies* in a collection of records (Why?)

2

- Sort-merge join algorithm involves sorting.
- Problem: sort 1Gb of data with 1Mb of RAM.
  why not virtual memory?

CISC 432/836

	Sort					
Ν	B=3	B=5	B=9	B=17	B=129	B=252
100	7	4	3	2	1	1
1,000	10	5	4	3	2	2
10,000	13	7	5	4	2	2
100,000	17	9	6	5	3	3
1,000,000	20	10	7	5	3	3
10,000,000	23	12	8	6	4	3
100,000,000	26	14	9	7	4	4
1,000,000,000	30	15	10	8	5	4

# Internal Sort Algorithm

- Quicksort is a fast way to sort in memory.
  Always produces [N/B] runs of B pages
- Replacement sort creates runs of 2B pages on average
  - For buffer of *B* pages use 1 page for input, 1 page for output and *B*-2 pages for current set

8

CISC 432/836

#### I/O Cost - Blocked I/O

- Minimize number of I/O's => maximize fan-in of merge => 1 buffer page per run => do I/O a page at a time
- Can reduce I/O cost if we read a block of pages sequentially *blocked I/O* 
  - But this will reduce fan-out during merge passes!
  - In practice, most files still sorted in 2-3 passes.

10

CISC 432/836

Sort							
N	B=1,000	B=5,000	B=10,000				
100	1	1	1				
1,000	1	1	1				
10,000	2	2	1				
100,000	3	2	2				
1,000,000	3	2	2				
10,000,000	4	3	3				
100,000,000	5	3	3				
1,000,000,000	5	4	3				

- Is this a good idea?
- Cases to consider:
  - B+ tree is clustered Good idea!
  - B+ tree is not clustered Could be a very bad idea!

13

15

- External sorting is important; DBMS may dedicate part of buffer pool for sorting!
- External merge sort minimizes disk I/O cost: – Pass 0: Produces sorted *runs* of size *B* (# buffer
  - pages). Later passes: merge runs.
  - # of runs merged at a time depends on *B*, and *block size*.
  - $\ -$  Larger block size means less I/O cost per page.
  - Larger block size means smaller # runs merged.

– In practice, # of runs rarely more than 2 or 3.  $_{\rm CISC\,432R36}$ 

## Summary (Cont.)

- Choice of internal sort algorithm may matter:
  - Quicksort: Quick!
  - Heap/tournament sort: slower (2x), longer runs
- Clustered B+ tree is good for sorting; unclustered tree is usually very bad.
